SYNOPTIC ABSTRACT

Let there be $k \geq 1$ ($k \geq 2$) independent two-parameter exponential populations with unknown guarantee times and a common standard deviation, where one of the populations is a control. If the best population is defined to be the one with the largest guarantee time, selection procedures for selecting the best population which is better than a control are proposed. Depending on whether the common standard deviation is known or unknown, a single-stage and a two-stage procedure are considered, respectively. Tables necessary to implement these procedures are provided.

Key Words and Phrases: Two-parameter exponential distribution; largest guarantee time; better than a control.
