Distinguishing Characteristics	Objectivist/Positivist Approach	Constructivist/Interpretative Approach
Conception of and Approach to Real World	The real world and the truths it holds are waiting to be discovered.	The world is made real through people's actions and thoughts—it emerges and does not exist in some external and readily-discovered form.
Method for Analysis	The approach assumes a systematic set of methods that can lead ultimately to discovering truths about reality that will yield testable theories. <i>Truth</i> , in this context, is with a small letter <i>t</i> .	The approach assumes methods that are open to refinement that can illuminate how subjects construct reality; it does not presume a generalizable truth about reality. The aim is to identify the meaning people construct as they interact.
Role of Researcher	The researcher's stance is as observer, recorder, analyst of the data. The researcher stands apart from the research.	The researcher's interactions with subjects contribute to the emerging concepts and categories. The researcher functions as a participant as well as an observer. The data collected are co-constructed by the researchers and subjects studied.
Nature of Data	Rich data yields categories, ultimately categories that are privileged over experience.	Data includes the feelings and interpretations of what subjects reveal both explicitly as well as tacitly. Ultimately, it is possible that the data may remain at a more intuitive and impressionistic level.
Trustworthiness of the Findings	Reliability and validity can be achieved, allowing for the study to be replicated.	Hypotheses and concepts can be generated which other researchers can apply to similar research problems.
